3. Paying but then Not Wanting the Item

The customer inserts money but then decides they do not want to buy an item

Objective	When the customer selects their item, the price as well as the item number displays on the 7-segment display and the customer puts in the money using the switches. When they decide, they don't want to buy an item, they can hit button 1 which is the cancel/refund button which will give them their money back. This must be done before pressing the vend button as the specifications state	
Results	The customer can choose their item and the price as well as item number should appear as well as the money they put in. The final result when they hit the cancel button should clear the money they put into the machine	
Actors	Basic understanding of how the system works, but other than that it should hopefully be straight forward	
Related use cases	Buying an item, Receiving change after purchasing an item, Not buying an Item	
Trigger	Hitting the refund/cancel button	
Stakeholders	The owner of the machine is interested in this as well as the customer who is buying an item from the machine	
Resources	Quartus and the SoC Series V Board	
Assumptions	A working setup with the seven-segment display, working money switches, working RAM set up for items and the working keypad as well	
Post-condition	The system itself shouldn't change, but the 7-segment should be reset back blank or zero	
Frequency	Unsure. It could be slim to rare, but it still depends on the customer	
Mission Priority	Again tied directly to frequency. It depends on the customer, but for specifications this is a high priority but in practical sense, the usage is up to the customer	
Safety Priority	I hope there is no safety concern	
Flow of events	**Step #**	**Action**
	1.	Customer browses the catalog of items
	2.	Customer chooses item that they want
	3.	Price of chosen item displays on 7-seg display

	4.	Customer inputs money values through the switches
	5.	The customer hits the refund/cancel button(button1) to get their money back
	6.	Customer "receives" their money back
Hazard/ Result /Mitigation	• If this case is done incorrectly, the entire system is likely incorrect or not working to specifications	
Requirements from Use Case	• Output value of chosen item and the cost of said item as well as other items when the customer is browsing the selection • Input value of money and output the value that is inputted • If there is change, also include that price on the 7-segment • Need the work cancel/refund button to reset the price and refund the money
